Netflix, Inc is an American technology and media services provider and production company headquartered in Los Gatos, California. Ne lix was founded in 1997 by Reed Hastings and Marc Randolph in Scott's Valley, California. The company's primary business is its subscription-based streaming service, which offers online streaming of a library of films and television series, including those produced in-house.

Stories move us.

They make us feel more emotional

See new perspectives,

And bring us closer to each other.

Business Problem

Analyse the data and generate insights that could help Netflix Inc. deciding which type of shows/movies to produce and how they can grow the business in different countries

1) Defining Problem Statement & Analysing Basic Matrices by Importing Libraries: ---

- **Importing the libraries we need**.

import NumPy as np import
pandas as pd import
matplotlib import
matplotlib.pyplot as plt import
seaborn as sns

- **Loading The Dataset**

Using Pandas Library, we'll load the CSV file. Named it with netflix_df for the dataset.
netflix_df = pd. read_csv("Netflix, link .csv")

```
[ ]  import pandas as pd
     netflix_df = pd.read_csv("https://d2beiqkhq929f0.cloudfront.net/public_assets/assets/000/000/940/original/netflix.csv")
```

- **Now Checking the Shape of the Data: ---**

```
netflix_df.shape
(8807, 12)
```

- **Now we have converted Date added column to Date Time: ----**

```
print(netflix_df.dtypes)
netflix_df[["date_added"]]=netflix_df[["date_added"]].apply(pd.to_datetime)
print(netflix_df.dtypes)
```

```
show_id          object
type             object
title            object
director         object
cast             object
country          object
date_added       object
release_year      int64
rating           object
duration         object
listed_in        object
description      object
dtype: object
show_id                 object
type                    object
title                   object
director                object
cast                    object
country                 object
date_added      datetime64[ns]
release_year             int64
rating                  object
duration                object
```

- **Let's check the first 5 data: ----**

netflix_df.head()

```
netflix_df.head()
```

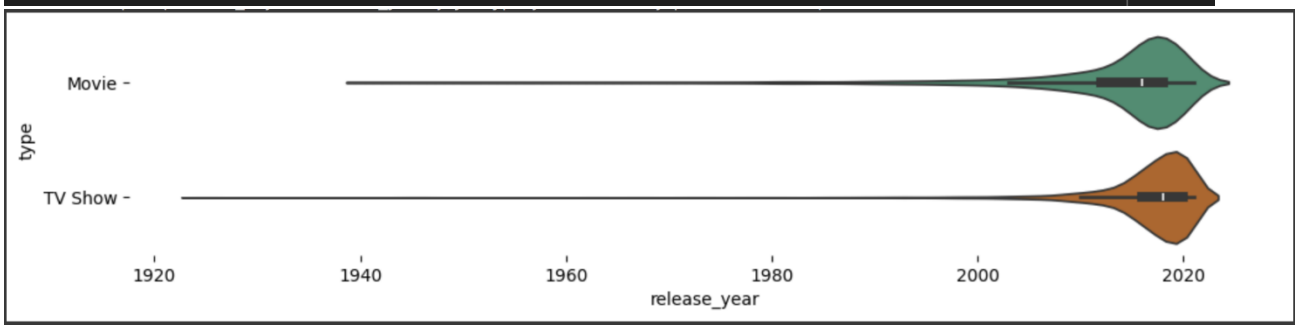
8807 rows × 12 columns

The dataset contains over 8807 titles(rows), 12 attributes (Columns). A era quick view of the data frames, it looks like a typical movie/TV shows data frame without ranges. We can also see that there are Null values in some columns, at the same time in some columns there are comma separated values.

- **Title type Vs Release Year: ---**

```
# @title type vs release_year

from matplotlib import pyplot as plt
import seaborn as sns
figsize = (12, 1.2 * len(netflix_df['type'].unique()))
plt.figure(figsize=figsize)
sns.violinplot(netflix_df, x='release_year', y='type', inner='box', palette='Dark2')
sns.despine(top=True, right=True, bottom=True, left=True)
```



2) **Observations on the shape of data, data types of all the attributes, conversion of categorical attributes to 'category' (If required), missing value detection,**

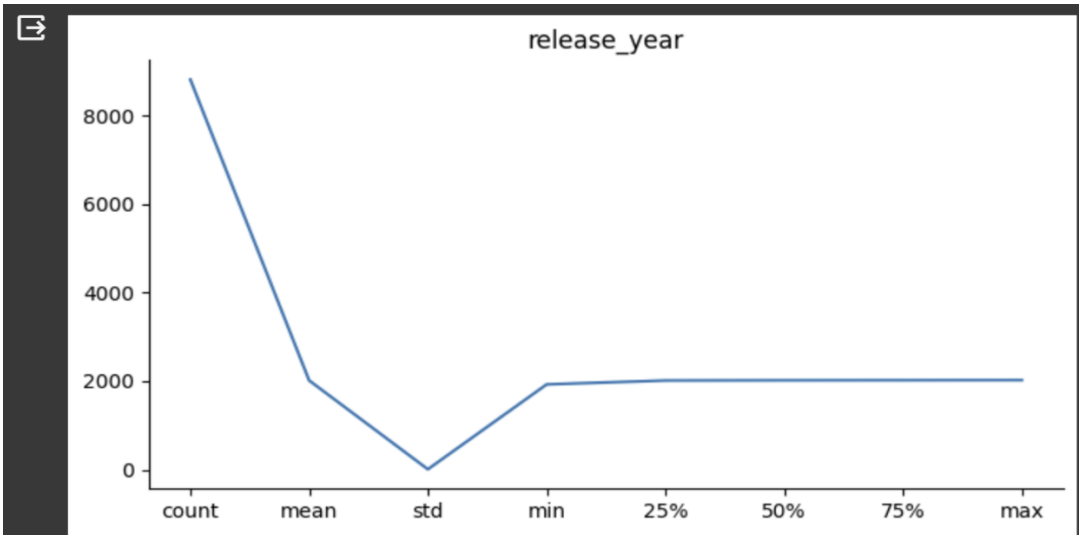
- **Statistical Summary Before Data Cleaning: -----**

```
netflix_df.describe()
```

	release_year
count	8807.000000
mean	2014.180198
std	8.819312
min	1925.000000
25%	2013.000000
50%	2017.000000
75%	2019.000000
max	2021.000000

- **Graphical Presentation of Statistical Summary before Data Cleaning: ---**

```
from matplotlib import pyplot as plt
_df_1['release_year'].plot(kind='line', figsize=(8, 4), title='release_year')
plt.gca().spines[['top', 'right']].set_visible(False)
```

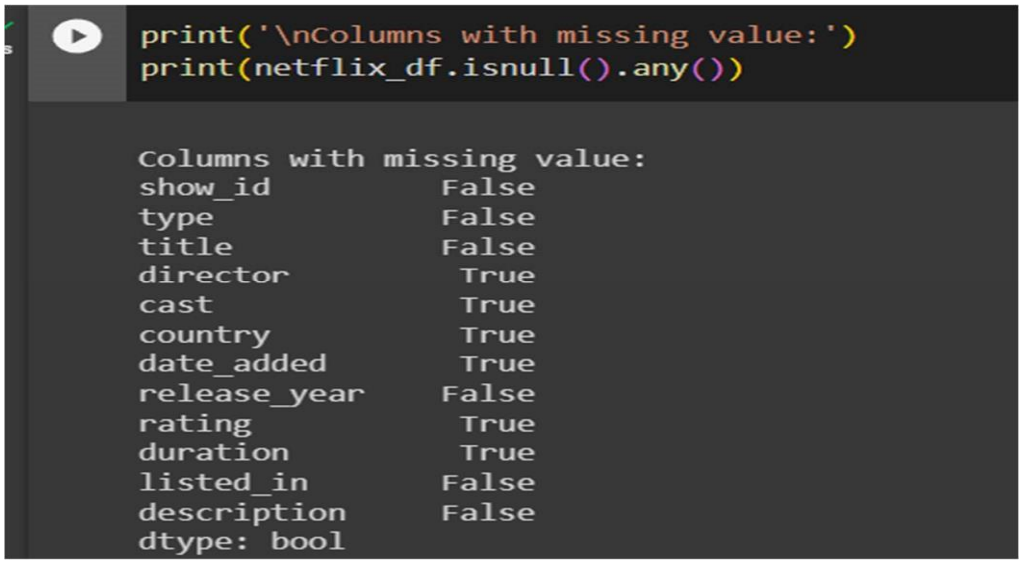


3) Missing Value Detection: ---

- **Data Profiling & Cleaning: ----**

Data Cleaning means the process of identifying incorrect, incomplete, inaccurate, irrelevant, or missing pieces of data and then modifying, replacing, or deleting them as needed.

print('\nColumns with missing value:')
print(ne lix_df.isnull().any())



From the info, we know that there are 8807 entries and 12 columns to work with. There are a few columns that contain null values, “director,” “cast,” “country,” “date_added,” “rating.”

netflix_df.T.apply(lambda x: x.isnull().sum(), axis = 1)

netflix_df.isnull().sum().sum()

4307

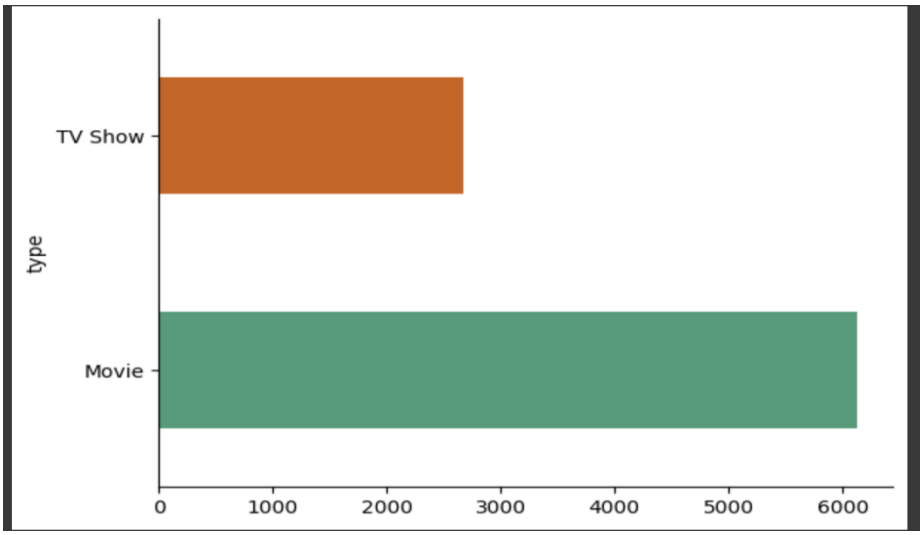
There are a total of 4307 null values across the entire dataset with 2634 missing points under "director", 825 under "cast", 831 under "country", 10 under "date_added", 4 under "rating" and 3 under “duration ”. We will have to handle all null data points before we can dive in further.

```
netflix_df.director.fillna("No Director", inplace=True)
netflix_df.cast.fillna("No Cast", inplace=True)
netflix_df.country.fillna("Country Unavailable", inplace=True)
netflix_df.dropna(subset=["date_added", "rating"],inplace=True)
```

- Graphical Comparison between TV shows & Movie Availability: ----

```
# @title type

from matplotlib import pyplot as plt
import seaborn as sns
netflix_df.groupby('type').size().plot(kind='barh', color=sns.palettes.mpl_palette('Dark2'))
plt.gca().spines[['top', 'right',]].set_visible(False)
```



4) Exploratory Analysis and Visualization: ----(Visual Analysis - Univariate, Bivariate after preprocessing of the data.)

- **Visual Analysis: ---**

A==>Pie plot:

Netflix Content By Type

Analysis entire Netflix dataset consisting of both movies and shows. Let's compare the total number of movies and shows in this dataset to know which one is the majority.

plt.figure(figsize=(6,3))

plt.title("Percentation of Netflix Titles that are either Movies or TV Shows")

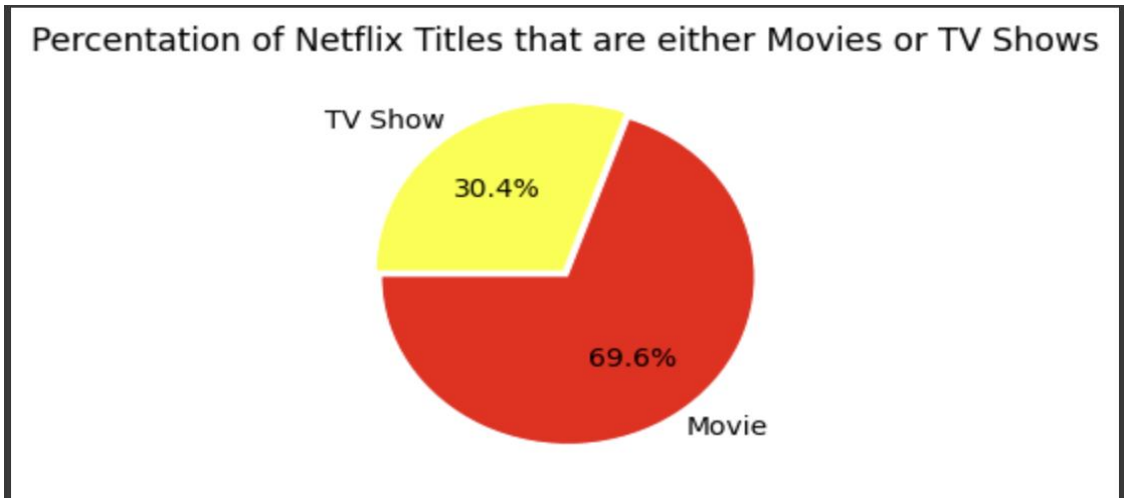
g=plt.pie(netflix_df.type.value_counts(),explode=(0.025,0.025),

labels=netflix_df.type.value_counts().index, colors=['red','black'],autopct='%1.1f%%',

startangle=180)

plt.show()

```
# 1)
from matplotlib import pyplot as plt
plt.figure(figsize=(6,3))
plt.title("Percentation of Netflix Titles that are either Movies or TV Shows")
g=plt.pie(netflix_df.type.value_counts(),explode=(0.025,0.025),
labels=netflix_df.type.value_counts().index, colors=['red','yellow'],autopct='%1.1f%%',
startangle=180)
```



There are far more movie titles (69.6%) that TV shows titles (30.4%) in terms of title.

- **Amount of Content as a Function of Time: Distplot**
  we will explore the amount of content Netflix has added throughout the previous years. Since we are interested in when Netflix added the title onto their platform, we will add a "year_added" column to show the date from the "date_added" columns: ---

- netflix_df["year_added"] = pd.to_datetime(netflix_df.date_added).dt.year
- netflix_movies_df["year_added"] = pd.to_datetime(netflix_movies_df.date_added).dt.year
- netflix_shows_df["year_added"] = pd.to_datetime(netflix_shows_df.date_added).dt.year
- netflix_year_df =
- netflix_df.year_added.value_counts().to_frame().reset_index().rename(columns={"index": "year",
- "year_added":"count"})
- netflix_year_df = netflix_year_df[netflix_year_df.year != 2020]
- print(netflix_year_df)

	year	count
0	2019	2016
2	2018	1648
3	2021	1498
4	2017	1185
5	2016	426
6	2015	82
7	2014	24
8	2011	13
9	2013	11
10	2012	3
11	2009	2
12	2008	2
13	2010	1

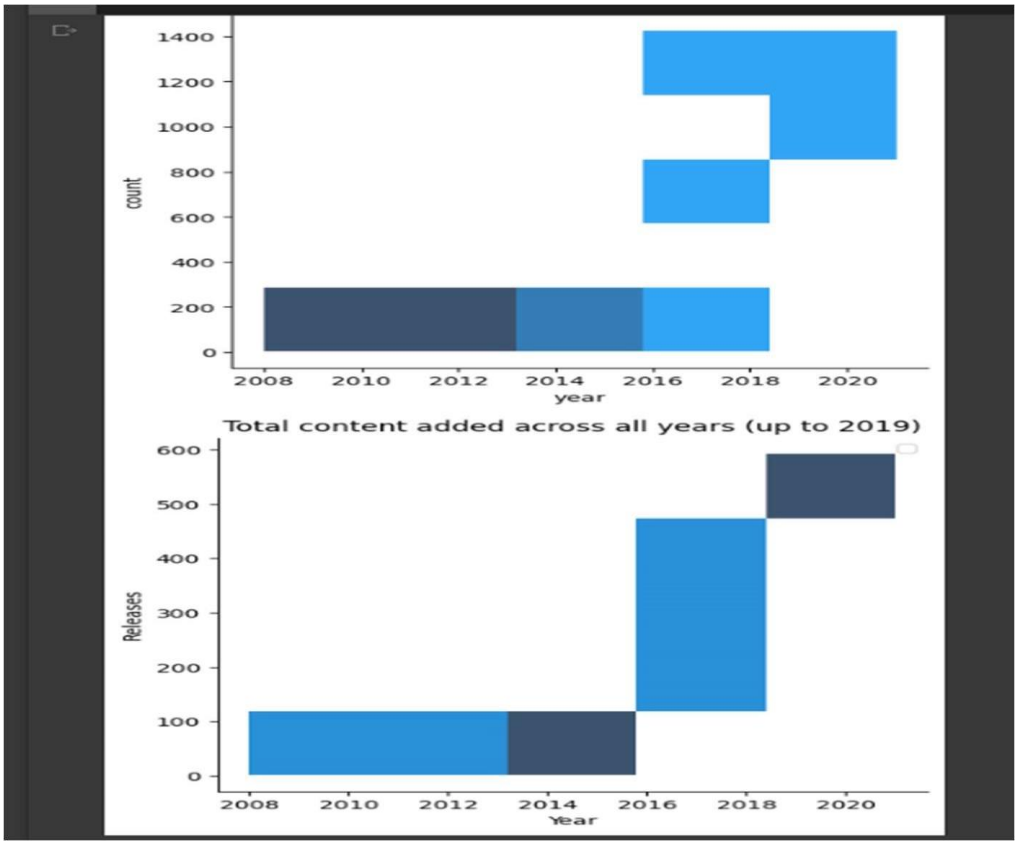
movies_year_df =
netlix_movies_df.year_added.value_counts().to_frame().reset_index().rename(columns={"index"
: "year", "year_added":"count"})
movies_year_df = movies_year_df[movies_year_df != 2020]
movies_year_df

	year	count
0	2019.0	1424
1	NaN	1284
2	2018.0	1237
3	2021.0	993
4	2017.0	836
5	2016.0	251
6	2015.0	56
7	2014.0	19
8	2011.0	13
9	2013.0	6
10	2012.0	3
11	2009.0	2
12	2008.0	1
13	2010.0	1

```
shows_year_df =
netflix_shows_df.year_added.value_counts().to_frame().reset_index().rename(columns={"index
": "year", "year_added":"count"})
shows_year_df = shows_year_df[shows_year_df != 2020]
shows_year_df
```

	year	count
0	NaN	595
1	2019.0	592
2	2021.0	505
3	2018.0	411
4	2017.0	349
5	2016.0	175
6	2015.0	26
7	2014.0	5
8	2013.0	5
9	2008.0	1

```
fig, ax = plt.subplots(figsize=(7, 5))
sns.displot(data=netflix_year_df, x='year', y='count')
sns.displot(data=movies_year_df, x='year', y='count')
sns.displot (data=shows_year_df, x='year', y='count')
ax.set_xticks(np.arange(2008, 2020, 1)) plt.title("Total content
added across all years (up to 2019)")
plt.legend(['Total','Movie','TV Show']) plt.ylabel("Releases")
plt.xlabel("Year")
plt.show()
```



Based on the timeline above, we can conclude that the popular streaming platform started gaining traction after 2013. Since then, the amount of content added has been increasing significantly. The growth in the number of movies on Netflix is much higher than that on TV shows. About 1,300 new movies were added in both 2018 and 2019. Besides, we can know that Netflix has increasingly focused on movies rather than TV shows in recent years

3) **Exploring the countries contribution with the most content of Netflix**.

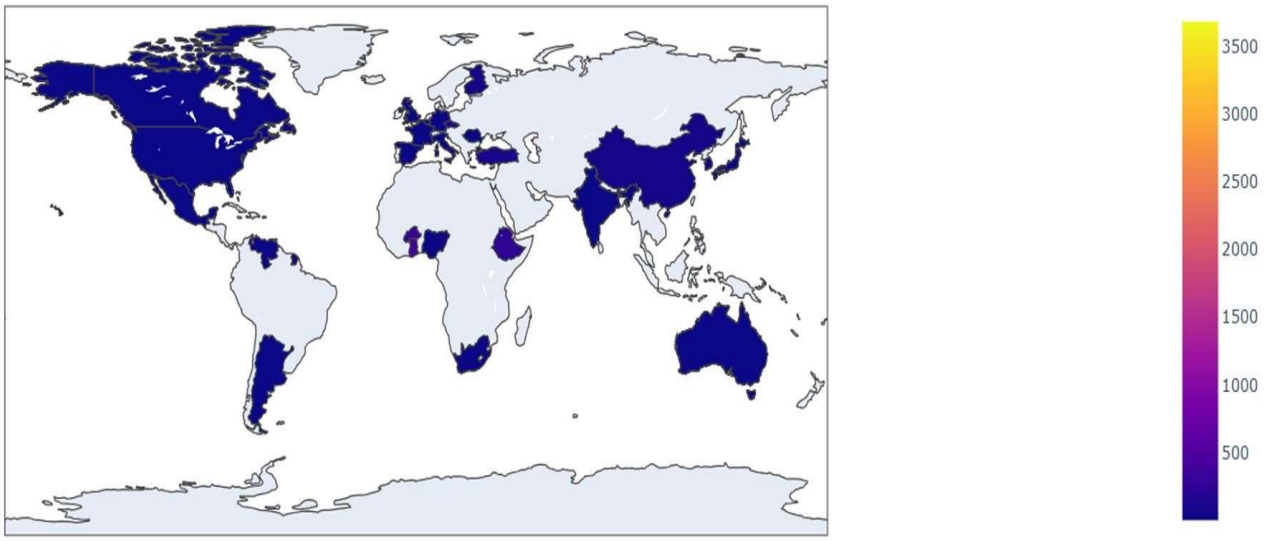
Next is exploring the countries by the amount of the produces content of Netflix. We need to separate all countries within a film before analysing it, then removing titles with no countries available.

```
import plotly.graph_objects as go
from plotly.offline import init_notebook_mode, iplot
```

We need to separate all countries within a film before analysing it, then removing titles with no countries available.

```
filtered_countries = netflix_df.set_index('title').country.str.split(', ',
expand=True).stack().reset_index(level=1, drop=True);
```

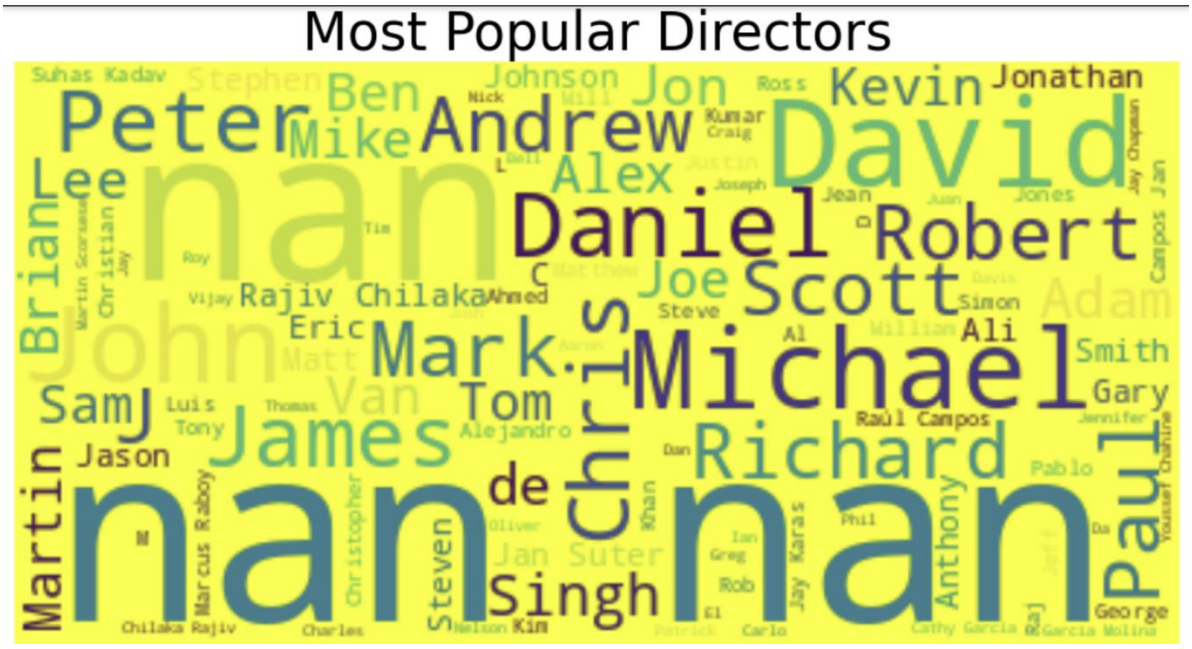
```
filtered_countries = filtered_countries[filtered_countries != 'Country Unavailable']
iplot([go.Choropleth( locationmode='country names', locations=filtered_countries,
z=filtered_countries.value_counts()
)])
```



4) Top Directors on Netflix

To know the most popular director, we can visualize it.

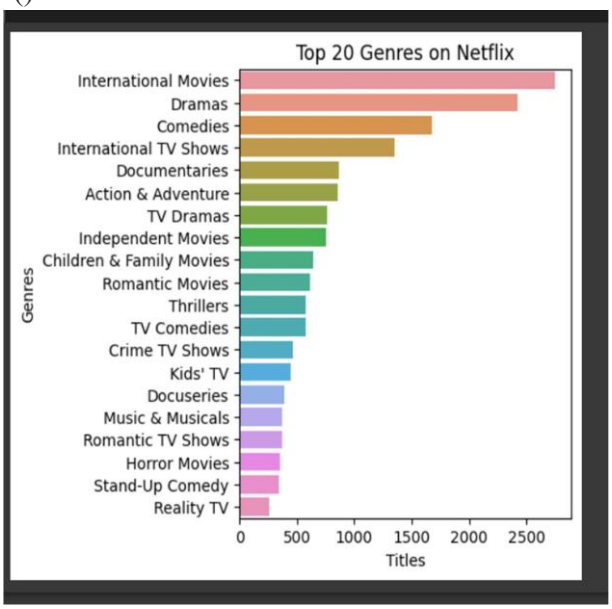
```
from wordcloud import WordCloud, ImageColorGenerator
text = " ".join(str(each) for each in netflix_df.director)
# Create and generate a word cloud image: ---
wordcloud = WordCloud(max_words=200, background_color="yellow").generate(text)
plt.figure(figsize=(8,6))
plt.figure(figsize=(12,10))
# Display the generated image:
plt.imshow(wordcloud, interpolation='Bilinear') plt.title('Most
Popular Directors',fontsize = 30)
plt.axis("off")
plt.show()
```



The most popular director on Netflix, with the most titles, is mainly international.

5) Top 20 Genres on Netflix: Count Plot: ---

```
filtered_genres = netflix_df.set_index('title').listed_in.str.split(', ',
expand=True).stack().reset_index(level=1, drop=True);
plt.figure(figsize=(4,5))
g = sns.countplot(y = filtered_genres,
order=filtered_genres.value_counts().index[:20])
plt.title('Top 20 Genres on Netflix')
plt.xlabel('Titles')
plt.ylabel('Genres')
plt.show()
```



From the graph, we know that International Movies take the first place, followed by dramas and comedies.

Bivariate Analysis: ---

Bi means two and variate means variable, so here there are two variables. The analysis is related to cause and the relationship between the two variables. There are three types of bivariate analysis.

A> Bivariate Analysis of two Numerical Variables (Numerical - Numerical)

4.2 For categorical variable(s): Boxplot

Duration Distribution for Movies and TV Shows

Analysing the duration distribution for movies and TV shows allows us to understand the typical length of content available on Netflix. We can create box plots to visualize these distributions and identify outliers or standard durations.

```
netflix_movies_df = netflix_df[netflix_df.type.str.contains("Movie")]

netflix_movies_df['duration'] = netflix_movies_df['duration'].str.extract('(\d+)',
expand=False).astype(int)

 # Creating a boxplot for movie duration

plt.figure(figsize=(10, 6))

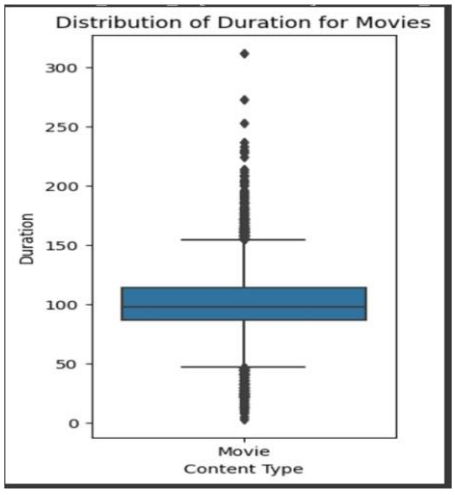
sns.boxplot(data=netflix_movies_df, x='type', y='duration')

plt.xlabel('Content Type')

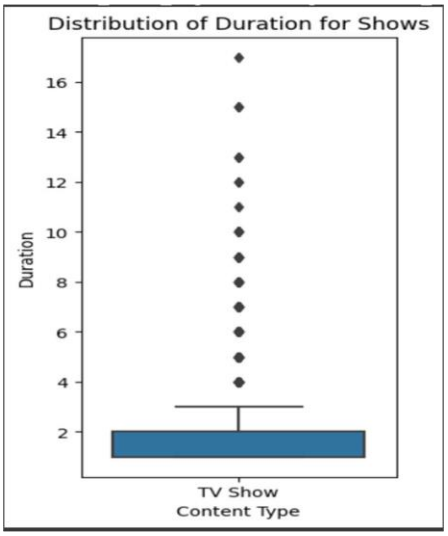
plt.ylabel('Duration')

plt.title('Distribution of Duration for Movies')

plt.show()
```



```
netflix_shows_df = netflix_df[netflix_df.type.str.contains("TV Show")]
netflix_shows_df['duration'] = netflix_shows_df['duration'].str.extract('(\d+)',
expand=False).astype(int)
 # Creating a boxplot for movie duration
 plt.figure(figsize=(3, 6))
 sns.boxplot(data=netflix_shows_df, x='type', y='duration')
 plt.xlabel('Content Type')
 plt.ylabel('Duration')
plt.title('Distribution of Duration for Shows')
 plt.show()
```



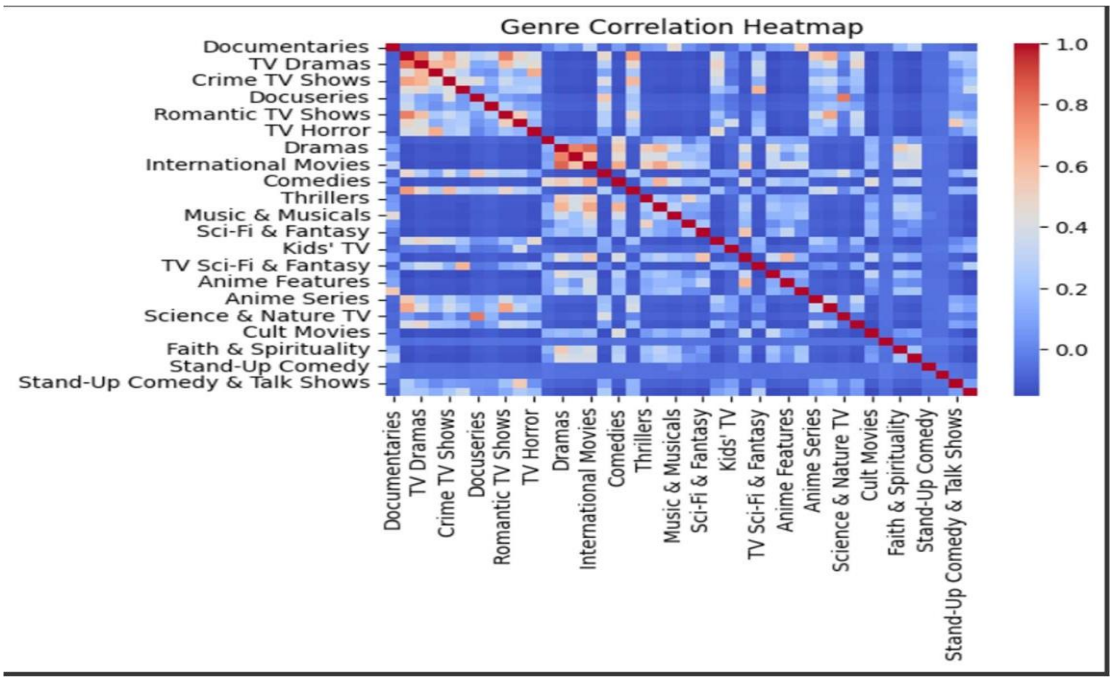
Analysing the movie box plot, we can see that most movies fall within a reasonable duration range, with few outliers exceedingly approximately 2.5 hours. This suggests that most movies on Netflix are designed to fit within a standard viewing time.

For TV shows, the box plot reveals that most shows have one to four seasons, with very few outliers having longer durations. This aligns with the earlier trends, indicating that Netflix focuses on shorter series formats.

4.3 For correlation: Heatmaps, Pairplots

Genre Correlation Heatmap: ---

Genres play a significant role in categorizing and organizing content on Netflix. analysing the correlation between genres can reveal interesting relationships between different types of content. We create a genre data Data Frame to investigate genre correlation and fill it with zeros. By iterating over each row in the original Data Frame, we update the genre data Data Frame based on the listed genres. We then create a correlation matrix using this genre data and visualize it as a heatmap.

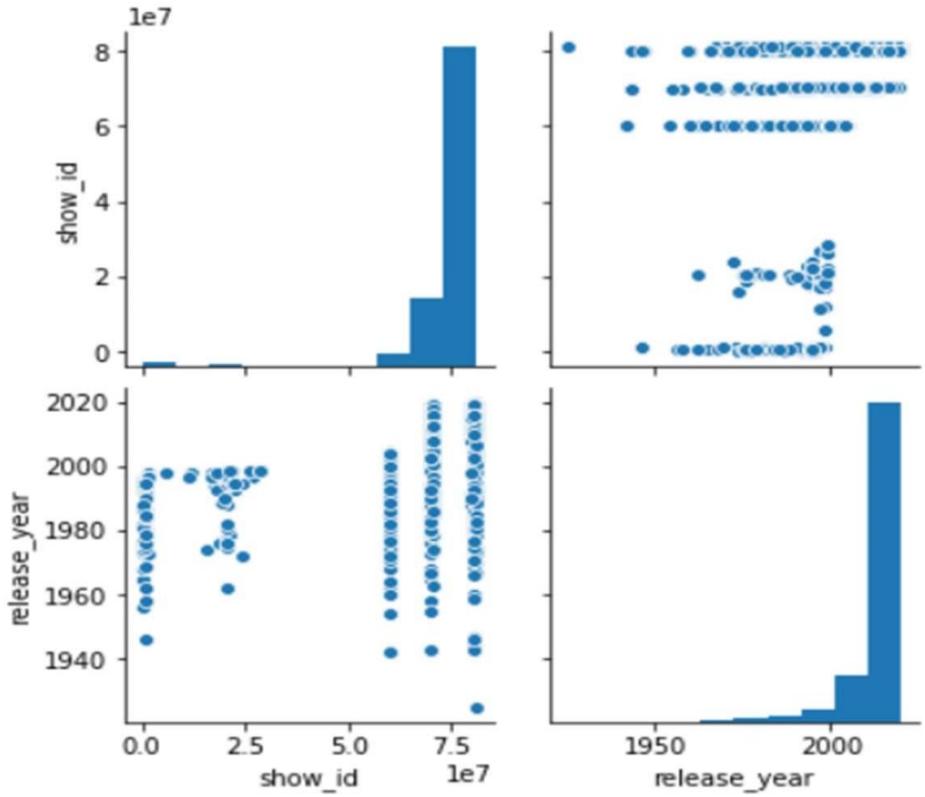


The heatmap demonstrates the correlation between different genres. By analysing the heatmap, we can identify strong positive correlations between specific genres, such as TV Dramas and International TV Shows, Romantic TV Shows, and International TV Shows.

Pairplots

A pairplot plot a pairwise relationships in a dataset.
The pairplot function creates a grid of Axes such that each variable in data will by shared in the y-axis across a single row and in the x-axis across a single column.

```
sns.pairplot(nf_df);
```



5) Missing Value & Outlier check (Treatment optional)

What is an outlier?

In a random sampling from a population, an outlier is defined as an observation that deviates abnormally from the standard data. In simple words, an outlier is used to define those data values which are far away from the general values in a dataset. An outlier can be broken down into out-of-line data.

For example, let us consider a row of data [10,15,22,330,30,45,60]. In this dataset, we can easily conclude that 330 is way off from the rest of the values in the dataset, thus 330 is an outlier. It was easy to figure out the outlier in such a small dataset, but when the dataset is huge, we need various methods to determine whether a certain value is an outlier or necessary information.

Why do we need to treat outliers?

Outliers can lead to vague or misleading predictions while using machine learning models. Specific models like linear regression, logistic regression, and support vector machines are susceptible to outliers. Outliers decrease the mathematical power of these models, and thus the output of the models becomes unreliable. However, outliers are highly subjective to the dataset. Some outliers may portray extreme changes in the data as well

Visual Detection

Box plots are a simple way to visualize data through quantiles and detect outliers. IQR (Interquartile Range) is the basic mathematics behind boxplots. The top and bottom

whiskers can be understood as the boundaries of data, and any data lying outside it will be an outlier.

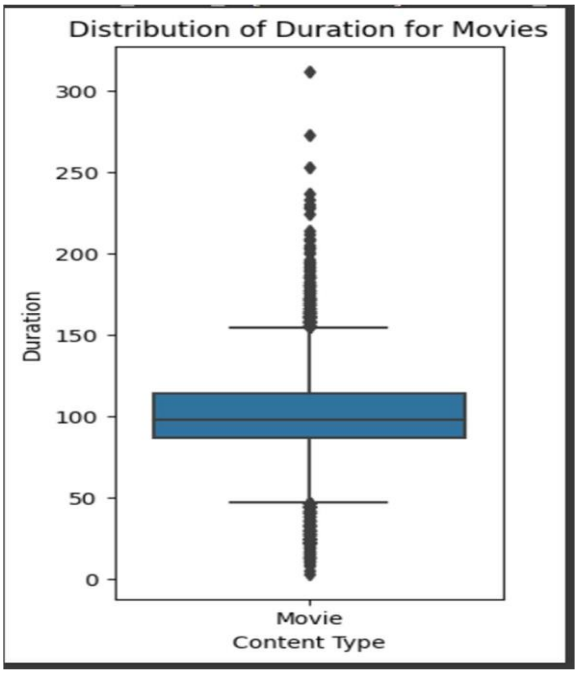
For categorical variable(s): Boxplot

Duration Distribution for Movies and TV Shows

Analysing the duration distribution for movies and TV shows allows us to understand the typical length of content available on Netflix. We can create box plots to visualize these distributions and identify outliers or standard durations.

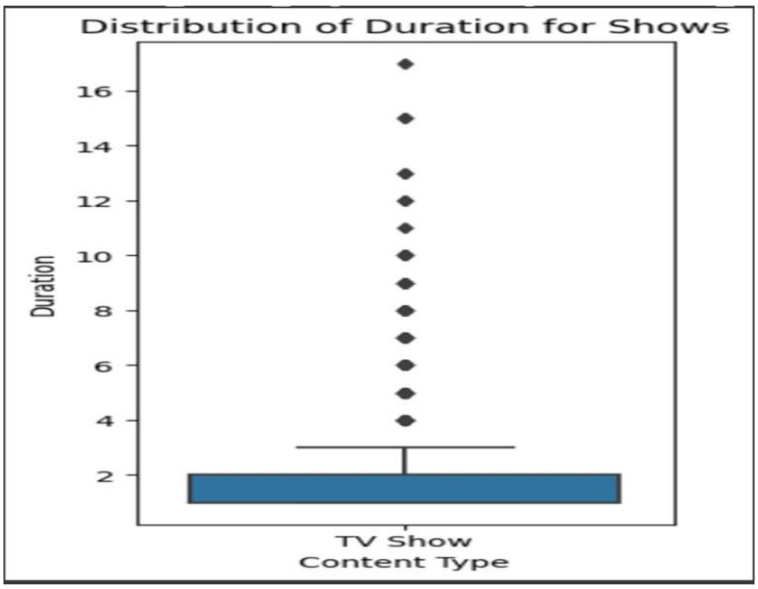
```
netflix_movies_df = netflix_df[netflix_df.type.str.contains("Movie")]
netflix_movies_df['duration'] = netflix_movies_df['duration'].str.extract('(\d+)', expand=False).astype(int)

# Creating a boxplot for movie duration
plt.figure(figsize=(10, 6))
sns.boxplot(data=netflix_movies_df, x='type', y='duration')
plt.xlabel('Content Type')
plt.ylabel('Duration')
plt.title('Distribution of Duration for Movies')
plt.show()
```



```
netflix_shows_df = netflix_df[netflix_df.type.str.contains("TV Show")]
netflix_shows_df['duration'] = netflix_shows_df['duration'].str.extract('(\d+)', expand=False).astype(int)

# Creating a boxplot for movie duration
plt.figure(figsize=(3, 6))
sns.boxplot(data=netflix_shows_df, x='type', y='duration')
plt.xlabel('Content Type')
plt.ylabel('Duration')
plt.title('Distribution of Duration for Shows')
plt.show()
```



Analysing the movie box plot, we can see that most movies fall within a reasonable duration range, with few outliers exceedingly approximately 2.5 hours. This suggests that most movies on Netflix are designed to fit within a standard viewing time.

For TV shows, the box plot reveals that most shows have one to four seasons, with very few outliers having longer durations. This aligns with the earlier trends, indicating that Netflix focuses on shorter series formats.

What are Missing values?

In a dataset, we often see the presence of empty cells, rows, and columns, also referred to as Missing values. They make the dataset inconsistent and unable to work on.

Many machine learning algorithms return an error if parsed with a dataset containing null values. Detecting and treating missing values is essential while analyzing and formulating data for any purpose.

Detecting missing values

There are several ways to detect missing values in Python. isnull() function is widely used for the same purpose.

dataframe.isnull().values.any() allows us to find whether we have any null values in the dataframe.

print('\nColumns with missing value:')
print(ne lix_df.isnull().any())

```
print('\nColumns with missing value:')
print(netflix_df.isnull().any())

Columns with missing value:
show_id          False
type             False
title            False
director          True
cast              True
country           True
date_added        True
release_year     False
rating            True
duration          True
listed_in        False
description      False
dtype: bool
```

From the info, we know that there are 8807 entries and 12 columns to work with for this EDA. There are a few columns that contain null values, “director,” “cast,” “country,” “date_added,” “ra ng.”

dataframe.isnull().sum() this function on displays the total number of null values in each column.

netflix_df.T.apply(lambda x: x.isnull().sum(), axis = 1)

```
netflix_df.T.apply(lambda x: x.isnull().sum(), axis = 1)

show_id          0
type             0
title            0
director      2634
cast           825
country        831
date_added      10
release_year     0
rating           4
duration         3
listed_in        0
description      0
dtype: int64
```

```
netflix_df.isnull().sum().sum()
```

4307

There are a total of 4307 null values across the en re dataset with 2634 missing points under "director", 825 under "cast", 831 under "country", 11 under "date_added", 4 under "ra ng" and 3 under “dura on ”. We will have to handle all null data points before we can dive into EDA and modelling.

Remedies to the outliers and missing values

Imputation is a treatment method for missing value by filling it in using certain techniques.

Can use **mean, mode, or use predictive modelling**. In this case study, we will discuss the use of the **fillna** function on from **Pandas** for this **imputation**. Drop rows containing missing values. Can use the d**ropna** function from Pandas.

```
netflix_df.director.fillna("No Director", inplace=True)
netflix_df.cast.fillna("No Cast", inplace=True)
netflix_df.country.fillna("Country Unavailable", inplace=True)
netflix_df.dropna(subset=["date_added", "rating"],
inplace=True)
```

Check missing value

```
netflix_df.isnull().any()
```

```
show_id         False
type            False
title           False
director        False
cast            False
country         False
date_added      False
release_year    False
rating          False
duration        False
listed_in       False
description     False
dtype: bool
```

For missing values, the easiest way to get rid of them would be to delete the rows with the missing data. However, this wouldn't be beneficial to our EDA since the is a loss of information. Since "director", "cast", and "country" contain the majority of null values, we chose to treat each missing value is unavailable. The other two label "date_added”,” duration” and "rating" contain an insignificant portion of the data so it drops from the dataset. Finally, we can see that there are no more missing values in the data frame.

Business Insights: ---

With the help of this article, we have been able to learn about-

1. Quantity: Our analysis revealed that Netflix had added more movies than TV shows, aligning with the expectation that movies dominate their content library.
2. Content Addition: July emerged as the month when Netflix adds the most content, closely followed by December, indicating a strategic approach to content release.
3. Genre Correlation: Strong positive associations were observed between various genres, such as TV dramas and international TV shows, romantic and international TV shows, and independent movies and dramas. These correlations provide insights into viewer preferences and content interconnections.
4. Movie Lengths: The analysis of movie durations indicated a peak around the 1960s, followed by a stabilization around 100 minutes, highlighting a trend in movie lengths over time.
5. TV Show Episodes: Most TV shows on Netflix have one season, suggesting a preference for shorter series among viewers.
6. Common Themes: Words like love, life, family, and adventure were frequently found in titles and descriptions, capturing recurring themes in Netflix content.
7. Rating Distribution: The distribution of ratings over the years offers insights into the evolving content landscape and audience reception.
8. Data-Driven Insights: Our data analysis journey showcased the power of data in unravelling the mysteries of Netflix's content landscape, providing valuable insights for viewers and content creators.
9. Continued Relevance: As the streaming industry evolves, understanding these patterns and trends becomes increasingly essential for navigating the dynamic landscape of Netflix and its vast library.
10. Happy Streaming: We hope this blog has been an enlightening and entertaining journey into the world of Netflix, and we encourage you to explore the captivating stories within its ever-changing content offerings. Let the data guide your streaming adventures!

RECOMMENDATIONS

- Netflix has to focus on TV Shows also because there are people who will like to see tv shows rather than movies
- By approaching the top director, we can plan some more movies/tv shows in order to increase the popularity
- Not only reaching top director we can also see the director with less no of movies and having high rating as there may be some financial
- issues or anything so in order to get good content Netflix can reach to them and Netflix can produce the movie and give the director a chance.
- We have seen most no of international movies genre so need to give priority to other genres like horror, comedy. Etc
- In TV Shows we may focus on thriller genre which will be helpful for having more no of seasons
- Most of the movies released in Ott is in a year 2019 so we need to go on increasing this value in order to attract people by showing that
- getting subscription is useful as Netflix is releasing more movies per year

- Mainly the release in Ott should focus on the festival holidays, year end and weekends which is to be mainly focussed
- Some movies can be released directly into Ott which has some positive talk which may help in improving subscriptions
- Should focus on an actor who has immense following and make use of it by doing a TV Shows or web series
- Advertisement in the country which has very less movies released should be increased and attract people of that country by making their native TV Shows
